

LBSystem::lbwebserverport

\$port = lbwebserverport();

Returns the Apache2 webserver port. Background:

Scripts and daemons do not need authentication if the request local plugin web resources, including htмлauth. To use this "locally no auth" function you have to use the <http://localhost> URI. As the Apache port is configurable with LoxBerry, a port 80 connection may fail. Therefore, use the lbwebserverport() function to acquire the current port.

Usage

```
require_once "loxberry_system.php";

$port = lbwebserverport();
$response = file_get_contents("http://localhost:$port/");
```
